

Notes:

- All labeled ground nodes connect independently to the main star point.
- For KT88 tubes, each bias test point should read 0.0625 volts after full warm up assuming 480 volts B+.
- For KT90 tubes, each bias test point should read 0.073 volts after full warm up, assuming 480 volts B+.
- Phase compensator is adjusted until amplitude readings off phase inverter are equal in height.
